

The condensed Leitz-Lexicon

Edition 5/1

leitz

Condensed Lexicon Edition 5/1

Survival in the rapidly changing global economy requires continuous improvement in production efficiency. No company, regardless of size, can survive using the same technology, processes and manpower that has worked in the past.

In order to survive and profit, we must all focus on our core competence, and partner with vendors who can provide new technologies which improve our efficiency and productivity.

Leitz is known as a leading tooling manufacturer and service provider, but we go a step further; Leitz also provides our partner companies with full technical support, production advice and industry experience.

This catalog is the condensed "quick reference" version of the well-known and more complete Letiz Lexicon. If we do not offer standard tooling to meet your needs, our experienced sales people would be happy to create a customized solution to address your specific application. We invite you to take full advantage of our complete range of products and services--as a complete package or tailored to meet your specific application requirements.

Please refer to the back of this catalog for a complete listing of regional offices and contact information. You may also visit us on the web at www.leitztooling.com. Our full catalog (Lexicon-CD) is available upon request at 800-253-6070.

1. Sawblades

1.1 Important information and tables

RPM diagram

Low-noise sawblades

Comparison of the efficiency of noise reduction for different designs of circular sawblades and edge quality Q depending on the direction of feed.

Advantages of low-noise sawblades

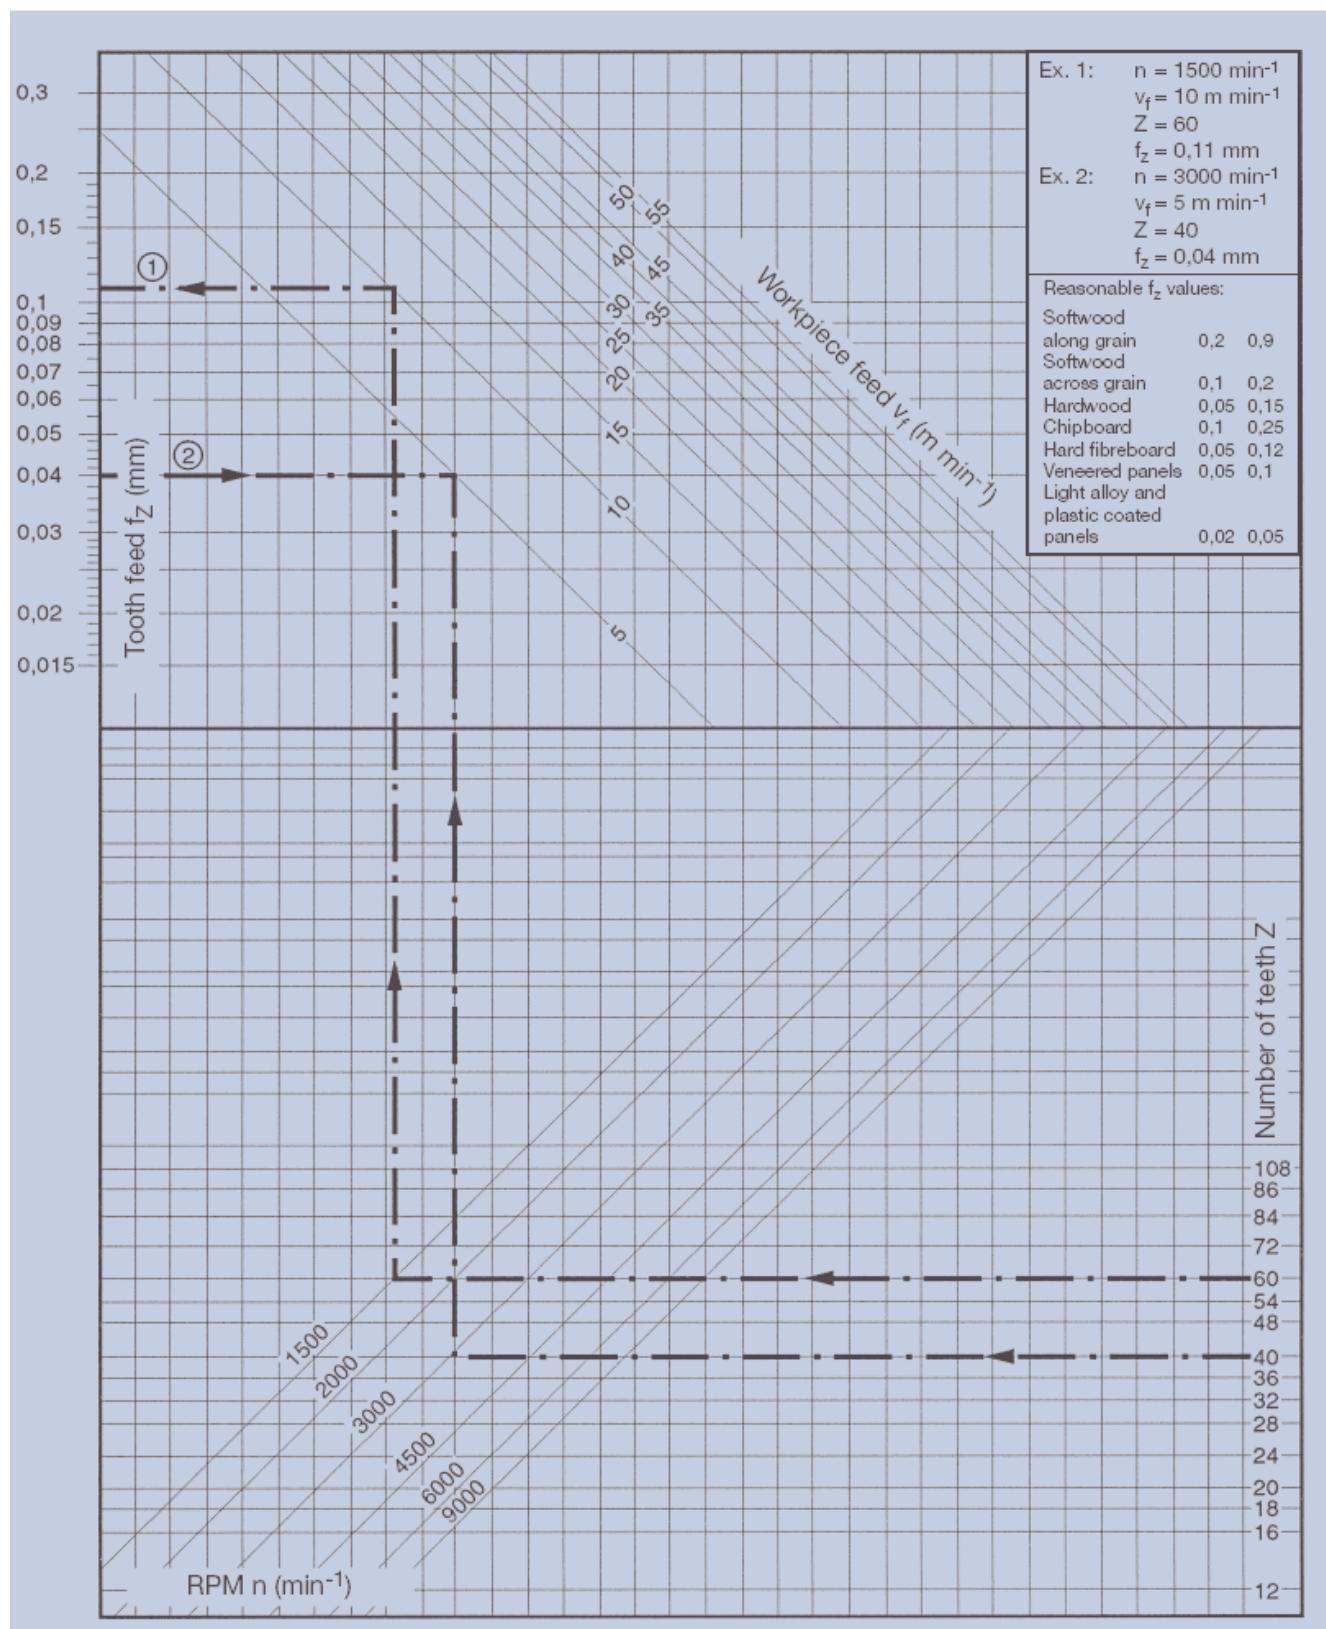

- Reduced noise and vibration.
- Longer run time from vibration damping.
- High cut quality, less wear and down time.
- Quiet running because of the high stability of the tool body.
- Reduced noise level of up to 10 dB(A) – 50% noise reduction – compared to standard sawblades.
- Better operator working conditions.
- Can be resharpened on all popular makes of automatic saw sharpening machines.

Recommended tooth progression fz (in mm) for panel sawblades and scoring sawblades

RazorCut "AS OptiCut UT"

Features

- Noise reduced design, tool body with vibration-damping laser ornaments and irregular pitched teeth.
- Cut geometry is optimized for best cut quality.

Advantages

- reduced vibrations
- better guidance in cut
- elimination of cutter marks on sides under optimum conditions
- reduced noise level

Applications

Material:
Wood derived, coated with foil or plastic

Machine:
Panel sizing machines, with scoring saw and pressure beam, sizing machines.

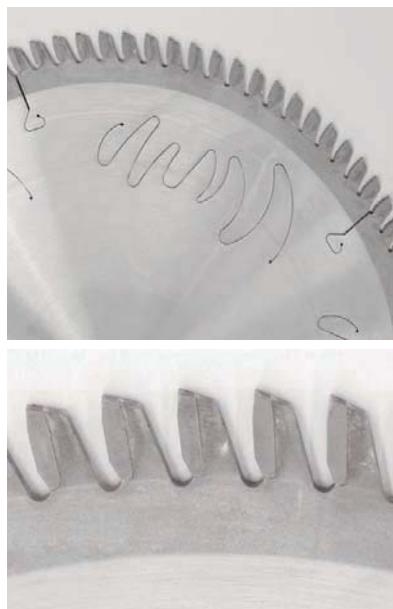

Double-check dimensions of bore-size, pinholes and keyways (PH/KW)!

- available ex stock
- available at short notice

1. Sawblades

1.6 GlossCut sawblades

With the new tooth shape and two cutting angles, minimum marks and tear-free cut edges can be achieved.

For plexiglass subsequent flame descaling is sufficient to achieve full transparency.

Application:

For sizing and cutting to length

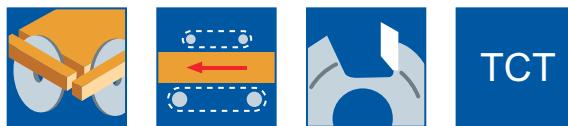

Machines:

Saw benches, sizing machines with/without pre-scoring sawblade, vertical and horizontal panel sizing machines, double circular dimension saw machines against feed from top and/or bottom.

Application:

Main sawblade against feed

For sizing in finish quality - GlossCut

Designed for sizing with perfect cut faces and tear-free cut edges. For sizing and cutting to length of transparent thermoplastics (PMMA, PC), duro plastics, plastic/alu-composite materials (Alucobond), MDF with and without coating. Vibration reduced sawplate by new laser ornaments - noise reduction whilst free running and in use.

WK 357 2

DIA mm	Kerf mm	Plate mm	Bore mm	PH1 mm	PH2 mm	Teeth mm	Grind	ID No.
300	3,0	2,4	30	2/10/60	2/7/42	60 > 20mm	FZFA/FZFA	761033 ●
300	3,0	2,4	30	2/10/60	2/7/42	96 < 20mm	FZFA/FZFA	761034 ●

Advantages:

The combination of vibration reduced saw bodies and teeth and a newly developed geometry gives a cut quality, which can be improved with a little additional work to brilliance.

In coated wooden fibre boards with a scoring sawblade a finish quality on the edges can be achieved.

Because of reduction/omission of the usually additional processing steps to the workpiece, the result is increased efficiency.

A noise reduction compared to standard sawblades of up to 4 dB(A) during the free running- and working cycle makes for more comfortable working conditions for the operator.

A significant improvement in the run time of about 200% from the tool construction compared to standard sawblades another economic tool solution.

Resharpening possible on all known sawblade sharpening machines.

4000-5000 RPM

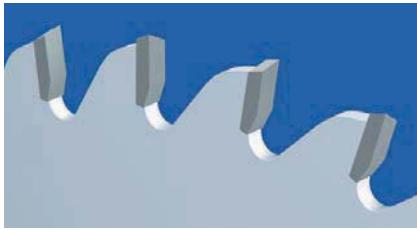

Application recommendation:

	Cutting speed	Feed per tooth
PMMA	60 - 70 m/s	0,01 - 0,02 mm
Thermoplastic	50 - 60 m/s	0,01 - 0,04 mm
Duro-plastic	40 - 70 m/s	0,02 - 0,05 mm
Aluminum / Thermoplastic composites	50 - 60 m/s	0,02 - 0,06 mm
Melamine coating - HPL coated wood fibre materials	60 - 90 m/s	0,03 - 0,10 mm

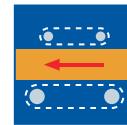

- available ex stock
- available at short notice

1. Sawblades

1.6 Cross Cut sawblades

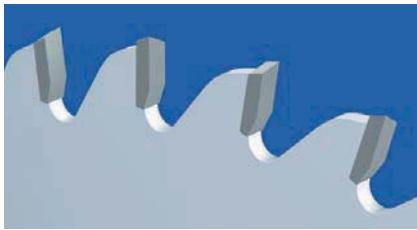

For cross cutting and sizing up to 90 mm cutting height

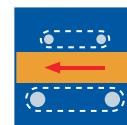

Designed for cutting across grain in dry solid woods and sizing uncoated timber products and laminated woods respectively up to 90 mm cutting height. For saw benches, sizing, cut-off and multi-blade saw machines.

2. Cutting tools with shank

2.1 General information

The dimensions in the table below refer to the following tool parameters:

DIA	diameter of the cutting edge
CEL	Usable cutting length with specified number of teeth,
AL	Possible working length, reached in separate steps
OAL	Total length
S DIA	Shank diameter, e.g. S25 x 60 -> Ø 25 mm
S	Shank length, e.g. S25 x 60 -> 60 mm

Application

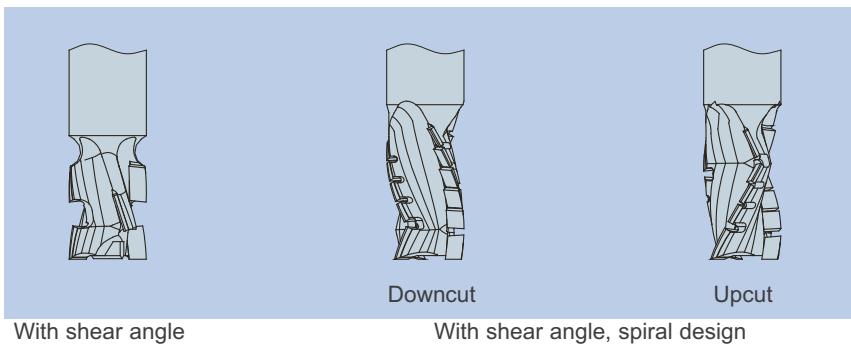

Workpiece material (recommended cutting material)

Sizing and grooving

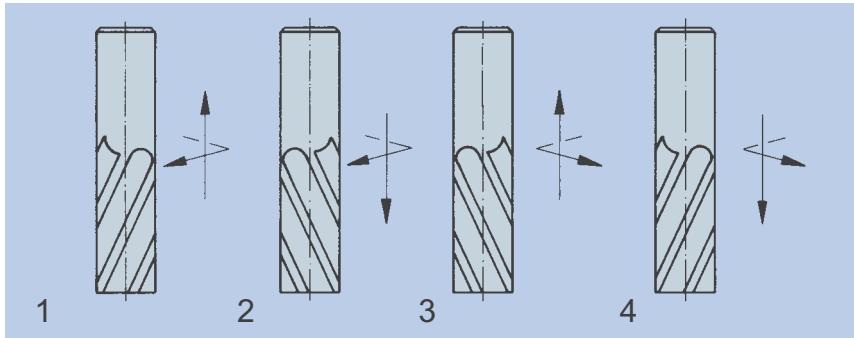

- Soft and hardwood (SP steel softwood only, HS, TC, TC-solid).
- Chipboard and fibre materials (MDF, HF, etc.), uncoated, with plastic coating, with veneer, etc. (TC, solid TC, DP).
- Plywood (TC, solid TC, DP).
- Duro-plastics (TC, solid TC, DP).
- Thermoplastics (HS, TC, solid TC, DP).
- Polymer plastics – Corian, Varicor, etc. – (TC, solid TC, DP).
- Laminated materials – HPL, Trespa, etc. – (solid TC, DP).
- Non-ferrous metal – Aluminium, copper, etc. – (HS, TC, solid TC, DP).

Design

Straight cutting edge

Spiral cutting edge

Router cutter DiaMaster QUATTRO Z(=Teeth)2+2

DP

High performance router cutter for sizing + pre-cutting, DP PLUS-tipped, Z (=Teeth) 2+2, finishing, with TC plunging tip. Suitable for machining coated timber and composite material workpieces at high feed speeds. Higher performance than Z (=Teeth) 1+1 DP routing tools.

Veneer across grain= 0,8

Positioning tool relative to the workpiece

Router cutter DiaMaster PLUS Z(=Teeth)3+3

See
Leitz-Lexicon

High performance router cutter for sizing + pre-cutting, DP PLUS-tipped, Z (=Teeth) 3+3, finishing, with DP-plunging tip. Suitable for machining coated timber and composite workpieces at high feed speeds. Higher performance than Z (=Teeth) 1+1 and Z (=Teeth) 2+2 DP routing tools. Negative twist to support the clamping of small workpieces.

WO 140-2 * With negative twist

2. Cutting tools with shank

2.5 Profile router cutter VariForm

Application	Machining profiles.																								
Workpiece material (recommended cutting material)	Soft and hardwood (TC1). Chipboard and fibre materials (MDF, HF, etc.), uncoated, with plastic coating, with veneer, etc. (TC2). Plywood (TC2). Duro-plastics (TC2). Thermoplastics (TC1, TC2). Polymer plastics (Corian, Varicor, etc.) (TC2). Note: Two different grades of TC blanks available – TC1, TC2.																								
Machine	Router machines with / without CNC, CNC machining centres, Special machines with spindle for shank tools.																								
Operation	With and against feed, limited chip removal.																								
Technical features	VariForm profile cutterheads can be used for many different profile machining operations. 2 different designs available: a) with profiled tool body for single pieces and small batches production. b) with profiled cutter blanks for prototype and single piece production.																								
Application Data	RPM/feed speed Recommended cutting speeds v_c and feed speeds f_z for multi-purpose cutterheads. <table border="1" style="margin-top: 10px;"> <thead> <tr> <th></th> <th>Cutterhead TC v_c [m/s]</th> <th></th> <th>Cutterhead TC f_z [mm]</th> </tr> </thead> <tbody> <tr> <td>Softwood</td> <td>60-90</td> <td>Solid wood along grain</td> <td>0,3 -0,5</td> </tr> <tr> <td>Hardwood</td> <td>50-80</td> <td>Solid wood across grain</td> <td>0,25-0,35</td> </tr> <tr> <td>Chipboard/MDF</td> <td>60-80</td> <td>Chipboard/MDF</td> <td>0,3 -0,5</td> </tr> <tr> <td>Plywood</td> <td>60-80</td> <td>Plywood</td> <td>0,25-0,35</td> </tr> <tr> <td>Plastic-coated board</td> <td>40-60</td> <td></td> <td></td> </tr> </tbody> </table>		Cutterhead TC v_c [m/s]		Cutterhead TC f_z [mm]	Softwood	60-90	Solid wood along grain	0,3 -0,5	Hardwood	50-80	Solid wood across grain	0,25-0,35	Chipboard/MDF	60-80	Chipboard/MDF	0,3 -0,5	Plywood	60-80	Plywood	0,25-0,35	Plastic-coated board	40-60		
	Cutterhead TC v_c [m/s]		Cutterhead TC f_z [mm]																						
Softwood	60-90	Solid wood along grain	0,3 -0,5																						
Hardwood	50-80	Solid wood across grain	0,25-0,35																						
Chipboard/MDF	60-80	Chipboard/MDF	0,3 -0,5																						
Plywood	60-80	Plywood	0,25-0,35																						
Plastic-coated board	40-60																								
Clamping the workpiece	To avoid problems of cut quality it is essential to clamp the workpiece sufficiently. Insufficient clamping will reduce both the quality of cut and tool lifetime. Panels can be held in place with vacuum clamping, but sometimes additional mechanical clamping is required (e.g. when machining TRESPA, etc). Small and arched workpieces must be clamped with special fixtures.																								
General information	Many profile shapes can be made with the profiled tool body design.

2. Cutting tools with shank

2.6 Clamping Systems

Collet chuck with hollow taper shank HSK-F 63

See
Leitz-Lexicon

Precision tool seating with collet for cylindrical shank tools. For shank diameters up to $d_{\max.} = 25$ mm. Hollow taper design to DIN 69893. Precise centric running from hardened, ground, double slit collets. Low vibration through short design. Easy tool handling as collet opens automatically when loosening the collet nut. Ball bearing collet nut for increased clamping forces and improved running accuracy compared to a one-piece design. Tool body and collet nut fine balanced. Mounting stand VN 799-0 see section 8, adjusting devices.

HSK-F 63 as per DIN 69893, A = 76 mm, clamping range 6-26 mm,
short design, 8° tapex angle of the collet

Collet chuck with hollow taper shank HSK-F 63

See
Leitz-Lexicon

Precision tool seating with collet for cylindrical shank tools. For shank diameters up to $d_{\max.} = 25$ mm. Hollow taper design to DIN 69893. Precise centric running from hardened, ground, double slit collets. Low vibration from short design. Easy tool handling as collet opens automatically on loosening the collet nut. Ball bearing collet nut for increased clamping forces and improved running accuracy compared to a one-piece design. Tool body and collet nut fine balanced. Mounting stand VN 799-0 see section 8, adjusting devices.

2.6 Clamping Systems

- ThermoGrip shrink-fit chuck
- Collet DIN 6388-B25,
75 Nm Tightening torque
- Collet DIN 6499-B32 (ER32),
75 Nm Tightening torque
- Hydro clamping chuck

The metric dimension of collets and hydro-clamping chucks includes shank tolerance g7 or h6.

Leitz ThermoGrip® chucks are designed for clamping diameters $d \leq 10$ mm for a shank tolerance h6, for clamping diameters $d > 10$ mm for a shank tolerance g6.

Shrink-fit chuck ThermoGrip®

See
Leitz-Lexicon

Tool clamping for high performance. Ideal for HSC-machining as balanced for RPMs up to 30.000 min⁻¹. Short, slim design for improved chip flow and extraction. For tungsten carbide and steel shanks. Clamping eccentricity $e = 0.01$ mm. ThermoGrip has the highest stability and rigidity of all known shank clamping systems.

3. Drilling

3.1 General information Dowel drills

Application	To drill tear-free dowel holes and blind holes.												
Workpiece material	Soft and hardwood. Chipboard and fibre materials (chipboard, MDF, HF, etc.), without coating, with plastic coating, with veneer etc. Glulam (plywood, etc.). Thermoplastics.												
Machine	Through-feed boring machines, Point-to-point boring machines, CNC-machining centres, Hinge boring machines, Special boring machines.												
Design	<p>Two designs of dowel drill are available:</p> <p>1. Design without heel Optimised dowel drill for machining panels in the furniture industry. Minimum friction and feed forces as the flute has a smaller diameter. A loose countersink can be clamped on the shank.</p>   <p>2. Design with heel Dowel drills with heel are used to bore holes in solid wood and for machines with insufficient guidance during the boring and return stroke. The boring bit is better guided during the exit stroke to prevent tear-outs at the edge of the hole when the boring bit leaves the workpiece. A loose countersink can be clamped on the shank.</p>  												
Shank	Dowel drills usually have a shank diameter $d = 10$ mm. Boring machines with only a small pitch between the boring spindles may use dowel drills with a shank diameter $d = 8$ mm. Additionally, it is possible to mount the dowel drills directly into the boring spindles with a threaded adaptor. Adaptors are available with different combinations of threads and either cylindrical or tapered seatings.												
Technical features	The dimensions listed in the tool tables refer to the following tool parameters:												
<table border="1"> <tr> <td>DIA</td> <td>Hole-diameter.</td> </tr> <tr> <td>S DIA</td> <td>Shank-diameter.</td> </tr> <tr> <td>S</td> <td>Shank length.</td> </tr> <tr> <td>CEL</td> <td>Working length = possible boring depth.</td> </tr> <tr> <td>OAL</td> <td>Total length of the boring bit including the projection of the centre-point.</td> </tr> <tr> <td>L</td> <td>Total length of the boring bit excluding the projection of the centre-point.</td> </tr> </table>		DIA	Hole-diameter. OAL	Total length of the boring bit including the projection of the centre-point.
L	Total length of the boring bit excluding the projection of the centre-point.

3. Drilling

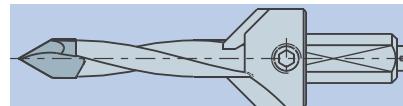

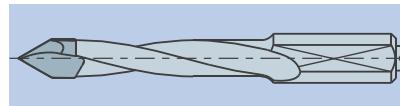

3.1 General information Through-hole drills

Design

Two designs of through-hole drills are available:

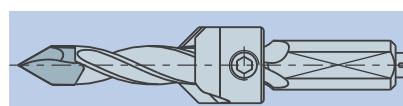

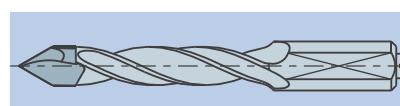

1. Design without heel

Optimised through-hole drill for machining panels in the furniture industry. Minimum friction and feed forces as the flute has a smaller diameter. A loose countersink can be clamped on the shank.

2. Design with heel

Dowel drills with heel are used to bore holes in solid wood and for machines with insufficient guidance during the boring and return stroke. The boring bit is better guided during the exit stroke to prevent tear-outs at the edge of the hole when the boring bit leaves the workpiece. A loose countersink can be clamped on the shank.

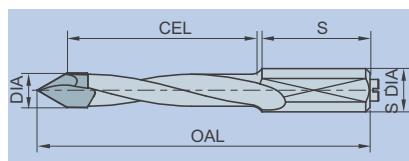

Shank

Through-hole drills usually have a shank diameter $d = 10\text{ mm}$. Boring machines with a small pitch between the boring spindles may use drills with a shank diameter $d = 8\text{ mm}$.

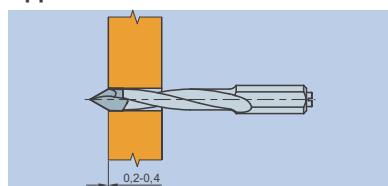

Technical features

The dimensions listed in the tool tables refer to the following tool parameters:

DIA	Hole-diameter.
S DIA	Shank-diameter.
S	Shank length.
CEL	Working length = possible boring depth.
OAL	Total length of the drill to the end of the centre-point.

Application recommendation

The boring quality in brittle or low-adhesive surfaces can be improved if the feed speed is reduced just before the drill breaks through the workpiece.

Leitz dowel drill program

	Standard bit	Marathon bit	Solid carbide bit
Application	Drilling of invisible holes in the craft industry	Drilling in industrial use, visible holes, difficult materials	Drilling in industrial use, visible holes, difficult materials
Design	Steel shank and body, HW-brazed tip, conventional design	Steel shank and body, HW-brazed tip, Marathon design	HW-drill, heat shrunk shank, Marathon design
Perform. Ratio	1	10	15

3. Drilling

3.1 General information Hinge boring bits

Design

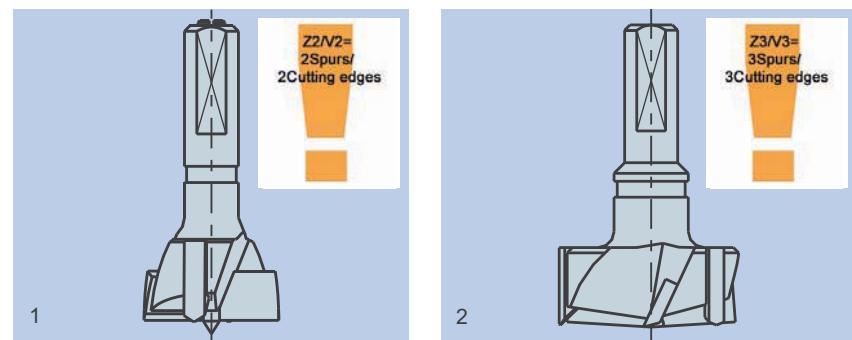

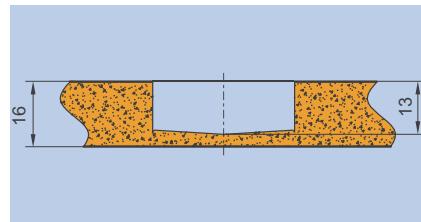

Two designs of hinge boring bits are available:

1. Design with center-point, 2 spurs and 2 spiral cutting edges (Z2/V2).

These boring bits are optimised for machining standard panels in the furniture industry.

2. Design without center-point, 3 spurs and 3 spiral cutting edges ground to a V-point (Z3/V3).

Recommended when there is the risk of the centre-point marking or breaking through the back of the panel e.g. boring a 13 mm deep hole in a 16 mm thick workpieces.

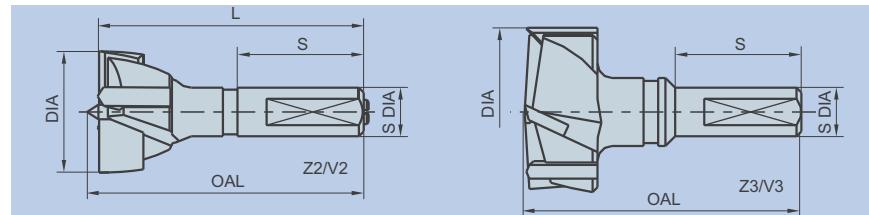

Shank

Hinge boring bits usually have a shank diameter S DIA = 10 mm. Internally threaded shanks are used in hand routing machines with the appropriate spindle adaptors.

Technical features

The dimensions listed in the tool tables refer to the following tool parameters:

DIA	Hole-diameter.
S DIA	Shank-diameter.
S	Shank length.
L	Total length of the hinge boring bit excluding the projection of the centre-point.
OAL	Total length of the hinge boring bit including the projection of the centre-point.

Application Data

RPM feed speeds

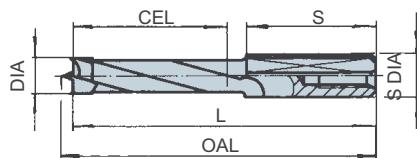

The optimum RPM and feed speeds are detailed in the diagrams attached to the tool tables.

Design Z2/V2 in solid tungsten carbide for extremely large regrinding area and increased feed speed, marathon design grind. Ideal for machining abrasive wood and composite materials as the solid tungsten carbide is more wear-resistant. Z3-design for higher feed speeds than Z2-design.

Without heel

Design with heel

Dowel drills with heel are used to bore holes in solid wood and for machines with insufficient guidance during the boring and return stroke. The boring bit is better guided during the exit stroke to prevent tear-outs at the edge of the hole when the boring bit leaves the workpiece. A loose countersink can be clamped on the shank.

Advantages compared to standard design:

Wear resistant carbide

- 2 to 3 times better performance
- rugged during application even under extreme conditions

Marathon geometry

- better cutting edges
- lower feed forces
- 30 % higher feed speeds

Open construction

- better chip clearance

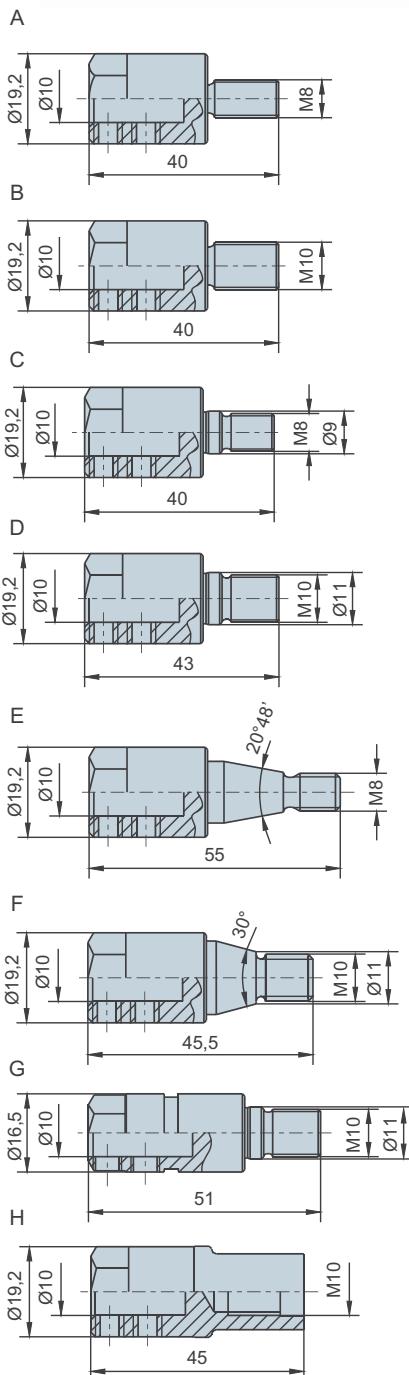

Service friendly

- spur and cutting edge can be sharpened in one step
- 6x resharpenable

- available ex stock
- available at short notice

Conventional bore clamping systems

Precise clamping from two clamping screws with ring shaped, notched pressure zone. Smallest possible pitch with 10 mm shanks – 21 mm. For smaller pitches use 8 mm shank adaptors.

Quick-change drill adaptor

The drills are clamped in the chuck by a special length setting screw (Id. 7408). Quick-change drill adaptors are ideal for quick and individual adjustment of the boring pattern. To protect the empty quick clamping chucks, seal with the dust cover. Note: to work correctly, the shanks need the correct shank and clamping flat tolerances. Only drills from the Leitz-programme guarantee reliability. RPM up to 12000 min⁻¹ (quick-change drill adaptor without drills must be sealed with the dust cover Id. 115521 to prevent unbalance).

Cutting material:

HS Marathon coated

- New HS knife programme, to meet the demands of planing mills, significantly improved performance over standard HS-knives.
- Significantly improved tool life compared to regular HS-knives, increased productivity and service life.
- Resistance to chemical and abrasive wear; suitable for both wet and dry wood.
- Low friction between chip and cutting edge; smoother cut and better work-piece surfaces.
- Less cleaning required because of reduced resin build-up.
- Sharpening and profiling by existing machines, fixtures and grinding wheels.

Knife height 30 mm, Marathon-Design

4. Knives

4.3 Knives and blanks

Process

Serrated back cutterheads are the most used tools for special and standard profiles. This chapter details tools suitable for producing different types of profiles. It covers all the different profiling tasks in industry and craft. There are many different applications and the individual product pages list the tool applications and possible materials.

Relationship between surface quality and length of knife marks $f_{z \text{ eff}}$

Blank knives suitable for many workpiece materials

HS-solid blanks for soft- and hardwood.
Thickness 5; 6; 8 mm for profile depths up to 30 mm.
Tungsten carbide tipped blanks for hardwood.
Thickness 10 mm for profile depths 10 and 18 mm.
Micro-serrated blank knives with backing plates for hardwood and MDF or HDF panel materials.
Thickness 10 mm for profile depths up to 30 mm.

Profile depths and tool diameter

The maximum profile depth depends on the knife thickness and height. The table below details the maximum profile depth and the tool cutting circle diameter for the different blanks.

	HS	HS	TC	ST	HS	TC	HS	ST
Knife thickness	5	8	10	10	8	10	8	10
Knife height	45	50	50	55	60	60	70	70
Profile depth	10	15	10	15	20	18	30	27
D max. bei TD								
135		174	174	184	194	194	214	214
145		184	184	194	204	204	224	224
150		189	189	199	209	209	229	229
165		204	204	214	224	224	244	244
170		209	209	219	229	229	249	249
190		220	229	239	249	249	269	269

Machines

Four-side moulders with or without high-precision spindles.
Four-side moulders with HSK 85 seating.

Type of application

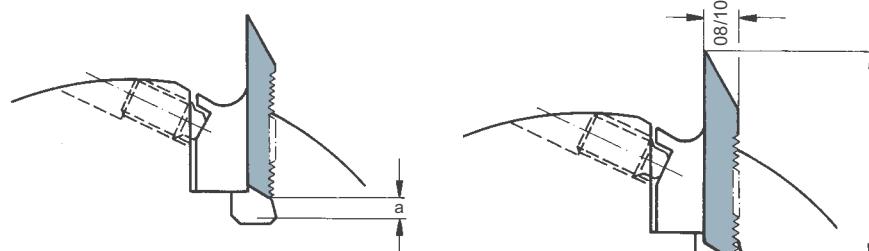

Profiling along the grain.

Resharpening area/ Setting area of the knives

The resharpening area is 6,4 mm when using the full profile depth.

The knives can be moved out a maximum of 4 serrations

Only for solid and tipped knives – not for TC-blanks with backing plates.

Attention:

For safety reasons, always use knives and backing plates (Packaging Unit = PU) with same weight in opposite seatings.

- New HS knife programme, to meet the demands of planing mills, significantly improved performance over standard HS-knives.
- Significantly improved tool life compared to regular HS-knives, increased productivity and service life.
- Resistance to chemical and abrasive wear; suitable for both wet and dry wood.
- Low friction between chip and cutting edge; smoother cut and better workpiece surfaces.
- Less cleaning required because of reduced resin build-up.
- Sharpening and profiling by existing machines, fixtures and grinding wheels.

5. Cutterheads

5.1 DP-Hogger set in cutter design

DiaMaster DT

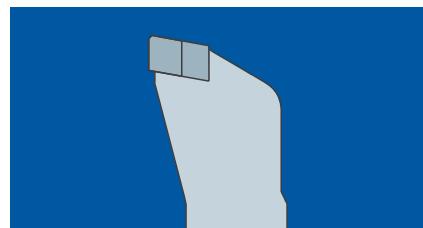

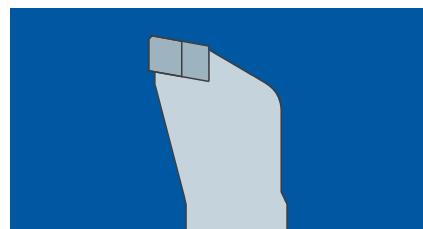

For hogging timber products, with/without coating, as well as light construction panels. Integrated tooth shape for a tear-free middle layer and break-out-free edges recommended for timber products with a high contaminant share. Tip height 6 mm; Regrinding area 4 mm.

For mounting on Hydro-clamping sleeve, flanged or quick change clamping sleeve: tooth shape decreasing – optimised for machining along and across grain.

Left-hand hogger set DIA-250 mm,
mounted without extension hogger for IMA machine:

Hogger set consisting of:

Sawblade DIA-250 mm, Z 48 ID No. 061831

Basic hogger DIA-250 mm ID No. 064410

Flanged sleeve ID No. 061650

When ordering, all single ID No. should be stated as in the example above
incl. mounting description.

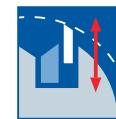

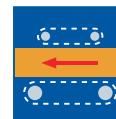

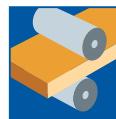

Flanged sleeves for other machine makes and quick-clamping sleeves,
see section 2.4.

Special flanged sleeves and DP-tipped segments available on request.

- available ex stock
- available at short notice

Planerhead HeliPlan with spiraly arranged cutting edges

Ideal for high chip flow; low power requirements and significant noise reduction from spiral mounted 4-side turnblade knives. Can be used for finish planing depending on quality requirement.

Minifinger joint cutter

Tipped minifinger cutter in rugged design in different cutting materials depending on workpiece material, with single brazed on **HS special** fingers to minimise breakages. Minifinger joint cutter, standard and double cutting width, HS special fingers.

Finger length 10 mm, pitch 3,8 mm

Cut production costs and shape your future - with Leitz tools

ProfilCut

Leitz ProfilCut is one of the finest custom insert tooling systems available. The combination of extremely tight cutter-head tolerances, exact positioning of knives, and polished micro grain carbide knives offer:

- Perfected cut and finish quality
 - Precision fit of mating parts
 - Reduction/elimination of sanding and scrap loss
 - Maximum service life and machine output
 - Reduced downtime due to cutter or knife changes
 - Optimized productivity and profitability

ProFix

Leitz ProFix is the ONLY constant diameter, constant profile, re-sharpen-able carbide or diamond profiling option available.

The unique ProFix System offers:

- Profile and machine flexibility
 - Excellent finish quality and fit of mating parts
 - Exceptional service life, and low maintenance cost
 - Minimal machine downtime due to knife changes
 - Optimized productivity and profitability

	Sawing from top solid wood		Hogging folding		Bevelling		Step drilling		Bevelling		Mech. edge clamping exchangeable		High-speed steel
	Sawing across grain trimming		Pre-planing horizontal		Bevelling rounding fluting		Slot mortising		Profiling		Mech. edge clamping reversible		Stellite
	Sawing multi purpose		Pre-planing vertical		Profiling		Excentric		Bevelling rounding fluting		Centrifugal edge clamping reversible		Tungsten Carbide
	Scoring sawing		Finish planing horizontal		Profiling glue joint		Boring/ cutting		Finger jointing		Mech. edge clamping not regivable		Tungsten carbide tipped
	Sawing packs		Finish planing vertical		Profiling finger joint		Carving		Mitre jointing		Mech. edge clamping not readjustable		Tungsten carbide for metal processing
	Sawing from top hollow profile		Planing profiling		Profiling mitre joint		Plug cutting		Counter-profile		Mech. edge clamping adjustable		Tungsten carbide for solid wood processing
	Sawing hollow profile		Grooving horizontal, vertical		Profiling counter-profiling		Interior cutting		Raised panels		Mech. edge clamping exchangeable and constant diameter		Tungsten carbide wood derived material processing
	Scoring hogging		Grooving lamello		Profiling tongue/groove		Exterior cutting roughing finishing		Mortising		Mech. edge clamping cassette system		Poly-crystalline diamond (PCD)
	Trimming		Finger jointing		Panel raising		Copy shaping		Coated high-speed steel		Centrifugal edge clamping reversible and regivable		Mono-crystalline diamond (MCD)

Service Capabilities

Raise your productivity to the next level

Leitz Service Team

Leitz Tooling Systems is the world's leading tooling manufacturer to the woodworking, plastics and non-ferrous metal industries. Leitz global coverage, international engineering network, and commitment to R&D constantly yield new and improved products to meet the ever-changing needs of our customers. Our unmatched production capabilities, and commitment to providing "perfect quality solutions", means you should never be dissatisfied with a Leitz product or service. These strengths allow us to offer the best possible tooling solution, at very competitive prices.

8 Service Centers in the US, 2 in CAN, 1 in Mexico

Leitz 11 "domestic" service centers located throughout the US, Canada and Mexico, combined with an extensive authorized distribution network; provide Leitz customers with the most complete service and support in the industry. Our experienced service technicians use the finest grinding machinery, precision measuring and inspection equipment, high tech balancing equipment, and the most current grinding technology to keep your cutting tools performing at optimal levels.

Quality Assurance

Leitz sales and service representatives will review your production center and suggest improved tooling solutions which will optimize your productivity and profitability. Our sales/service representatives will also arrange for timely pick up, reconditioning and return of your worn or dull tooling.

Our unparalleled combination of top quality products and worldwide industry experience makes Leitz Tooling Systems your ideal tooling partner. Please give Leitz the opportunity to show you tooling systems that can cut costs, improve profits and help shape your future.
